**SURFASOFT** skin graft fixation

**Fixate skin graft and protect vulnerable wound surfaces**

**SURFASOFT** is a woven fabric of polyamide fibres with 45% open porous structure. During the production process polyamide fibres are melted together and pore size is fixed.

**BENEFITS**
The porous structure of Surfasoft allows evaporation and drainage of wound fluids without drying the wound surface. Moist gauzes applied as secondary dressing will improve wound drainage, while antiseptics can be applied frequently without graft dislocation. These features make Surfasoft the perfect wound contact layer. Surfasoft is the ideal carrier for cultured cells and cell sheets guiding outgrowth of the epithelium. Outgrowth of epithelium is supported by a provisional matrix of polymerized fibrin and fibronectin at the wound surface in a very regular fashion. Maturation and keratinization of outgrown epithelial cells will start once drying. Surfasoft induces a moist environment suitable for epithelial outgrowth.

**FEATURES**
- Quick and easy to apply with sutures or staples
- Should be moistened with saline to facilitate pliability
- Creates a tight fit with wound surface
- Does not promote or induce infection
- Wound can be inspected throughout the treatment
- Antiseptics can be applied frequently without graft dislocation

**EXPERT OPINION**
“Since many years Surfasoft has been used extensively as a wound dressing material and has been applied successfully on hundreds of patients. The material is very suitable for the fixation of skin grafts and for the protection of vulnerable wound surfaces. Recently Surfasoft has successfully been applied as a wound contact layer in combination with cultured cells (spray, suspension or sheets) for scar remodelling or vitiligo treatment. Surfasoft ensures an uneventful wound healing without adhering to the wound surface or the healed epithelium.”
